Surgical Technique
Callos® Bone Void Filler and Autograft Extender, Manufactured by Skeletal Kinetics®

Callos Bone Void Filler is a synthetic calcium phosphate cement. It offers high compressive support for host bone that has been compromised. Synthetic calcium phosphates form a scaffold to allow bony ingrowth to occur through a cell-mediated remodeling process. In the cell-mediated remodeling process whereby host bone gradually replaces the synthetic calcium phosphate along with adjacent bone. Callos Bone Void Filler exhibits high compressive strength throughout the remodeling process.

Callos Bone Void Filler is radiopaque to facilitate its use during surgery. This allows proper placement in the reduced fracture and ensures the cancellous defect has been completely filled. Once mixed and placed into the bone void, it can be contoured to fill the defect. Callos Bone Void Filler does not "wash out" and is designed to set quickly in a warm, aqueous environment. In addition, Callos permits drilling and hardware insertion. Callos Bone Void Filler can be drilled and inserted with a screw to facilitate its use with hardware when treating periarticular fractures.

Indications for Use
Callos Bone Void filler is indicated to fill bony voids or gaps of the skeletal system (i.e. extremities, pelvis). These defects may be surgically created osseous defects or osseous defects created from traumatic injury to the bone.

Callos Bone Void Filler is indicated only for bony voids or gaps that are not intrinsic to the stability of the bony structure. The product provides a bone void filler that resorbs and is replaced by bone during the healing process.

Callos Basic Surgical Technique

1 Fracture Assessment and Planning
Preoperatively assess the fracture’s characteristics. Determine the approximate volume of Callos needed based on the predicted shape and location of the fracture void after reduction.

2 Reduction and Stabilization
Reduce and stabilize the intraarticular and extraarticular fracture fragments. Visually verify fracture reduction with an appropriate imaging technology.
Callos Basic Surgical Technique [continued]

3 Void Preparation
Proper fracture reduction and void preparation are important to provide an optimal cement fill. To assure optimal fill, the fracture void should be irrigated and debrided to remove any clots, organized tissue, and/or loose bone debris.

4 Callos Implantation
After mixing Callos Bone Void Filler according to the appropriate instructions and timing charts, inject or impact Callos Bone Void Filler into the reduced fracture void.

With Callos Inject, best practice is to inject the product in a retrograde fashion, filling the void from back to front.
Callos Impact Mixing Instructions

1 Preparing Materials
Unpack all components of the Callos Impact kit. Ensure the base of the mixer is rotated all the way up by rotating clockwise until the blue line is above the side port. Unscrew the top of the mixer and pour Callos Bone Void Filler liquid first into the mixing chamber. Second, pour Callos Bone Void Filler powder into the mixing chamber.

2 Mixing Materials
Screw the top of the mixer back on and rotate the handle briskly in a clockwise direction for 1 minute (100+ revolutions). Remove the top from the mixer and scrape the mixed Callos Bone Void Filler on the mixing paddle back into the mixer.

Caution: Do not mix with left hand (counterclockwise) this cause the base to loosen from the mixing chamber.

3 Removing Bone Void Filler From Mixer
Use the spatula to scoop Callos Bone Void Filler out of the mixer, scraping the sides of the mixer with the straight edge of the spatula. Form the putty into the desired shape. Callos is now ready for placement into a bone void. Follow Callos Bone Void Filler timing charts for working time during and after mixing.
Callos Impact Mixing Instructions [continued]

Operating Room Guidelines

**Temperature:**
- Operating room temperature should be between 19°C—21°C (66°F—70°F).
- The temperature of the Callos powder and liquid inside the vials should be less than or equal to 21°C (70°F).
- Callos needs warm body temperature (above 32°C/90°F) and a wet environment (e.g. blood) to set properly.
- If the tourniquet cannot be lowered, apply warm (body temperature) saline over the Callos or on the wet lap sponges covering the Callos area.
- Higher temperatures will speed up setting.
- Lower temperatures will slow down the setting.

**Drilling Callos**
- Drill only after the hard setting period (see Timing Chart).
- Drills must be fluted or threaded.
- **Caution:** Do not drill Callos with K-wires.
- Do not force drill into Callos; let the drill do the work.
- Allow an additional five minutes after initial screw insertion before final two-finger tightening of screws.

Callos Inject Mixing Instructions

1 Preparing Materials
Unpack all components of the Callos Inject kit. Ensure the base of the mixer is rotated all the way up by rotating clockwise until the blue line is above the side port. First, unscrew the top of the mixer and pour Callos Bone Void Filler liquid into the mixing chamber. Second, pour Callos Bone Void Filler powder into the mixing chamber.

2 Mixing Materials
Screw the top of the mixer back on and rotate the handle briskly clockwise for 1 minute (100+ revolutions). Remove the top from the mixer and scrape the mixed Callos Bone Void Filler on the mixing paddle back into the mixer.

Caution: Do not mix with left hand (counterclockwise). This will cause the base to loosen from the mixing chamber.

3 Preparation for Dispensing Into Syringe
Rotate the base of the mixer counter-clockwise all the way into the down position. The bottom of the base will be at the halfway line of the port. Insert the plunger and rotate down clockwise until the Callos Bone Void Filler starts extruding out of the port.

4 Syringe Attachment
Remove the cap from the syringe. Attach the syringe to the port on the mixer.
Callos® Bone Void Filler Surgical Technique

Callos Inject Mixing Instructions [continued]

5 Dispensing Bone Void Filler Into Syringe

Rotate the plunger down clockwise to extrude Callos Bone Void Filler into the syringe. Do not grip the body of the syringe while rotating the plunger during extrusion. Remove syringe from port and reattach cap.

6 Preparing For Bone Void Filler Injection

Remove the trocar from the cannula. Attach the cannula to the syringe. Callos Bone Void Filler is now ready for placement into a bone void. Follow Callos Bone Void Filler timing charts for working time during and after mixing.

Callos Inject Timing Chart

Operating Room Guidelines

Temperature:
- Operating room temperature should be between 19°–21°C (66°–70°F).
- The temperature of the Callos powder and liquid inside the vials should be less than or equal to 21°C (70°F).
- Callos needs warm body temperature (above 32°C/90°F) and a wet environment (e.g. blood) to set properly.
- If the tourniquet cannot be lowered, apply warm (body temperature) saline over the Callos or on the wet lap sponges covering the Callos area.
- Higher temperatures will speed up setting.
- Lower temperatures will slow down the setting.

Drilling Callos
- Drill only after the hard setting period (see Timing Chart).
- Drills must be fluted or threaded.
- Caution: Do not drill Callos with K-wires.
- Do not force drill into Callos; let the drill do the work.
- Allow an additional five minutes after initial screw insertion before final two-finger tightening of screws.
